
Operating parameters

Users on PBX or Centrex systems connected via tie trunks to a Meridian 1 Node can use the authcode conditionally last feature, provided that these systems transmit or repeat all digits dialed by the users in response to the authcode request. This feature cannot be used by certain systems that operate in senderized mode. Correct operation may require adjustment of EOD time-out on systems that employ simulated cut-through operation.

In a private network consisting of multiple switches equipped with the Authcode feature, authcodes should be requested only once on a given call. This requires careful engineering of

- the tie trunk group option for authcode prompting
- the minimum FRL values assigned to route lists

In a private network, users at a switch arranged for the Uniform Dialing Plan (UDP) via a dedicated trunk group to a Node can use the authcode conditionally last feature at the Node in the same manner as those stations located directly at the Node. However, these users cannot access the authcode via the same trunk group after the SPRE feature is activated.
